Public procurement has emerged in recent years, as a complex function that utilizes a great amount of public fund. Undeniably, public procurement has become a multifaceted system that consists of procurement laws and regulations, procurement processes (from approvals, appropriations, invitation to bid, bidding process, to contract award, and contract administration, etc.), Procurement methods (from open competitive bidding, pre-qualification to alternate methods of procurement etc.), procurement techniques (life-cycle costing, evaluation, negotiations, etc.), procurement organizational structure (procuring agencies, user departments), procurement professionalism (procurement offices and workforce).The public procurement function becomes further intricate when public procurement, becomes a policy tool due to the size of its spending. The policy makers use this tool to address community issues, environment protection (green procurement) and economic development (including local preferences). These policy apprehensions have made procurement practices thornier. Constantly changing global environment has further convoluted public procurement as procurement officers have to comply with international trade agreements along with national procurement legal framework. Consequently, there was a dire need of a textbook on procurement management to enhance the skills of procurement professionals and to update them with the advanced practices in procurement arena. This need, I presume, has been fulfilled to a great extent by publication of the two volumes of "Procurement Management". The second volume of "Procurement Management" covers the practical aspects of procurement practices. A number of chapters elucidate eloquently, varied areas of procurement management, which in consequence, will help to clear the concepts of procurement professionals. The decision of selection of a procurement

method is often regarded as the key decision in the procurement planning process and is one of the mandatory requirements in the annual procurement plan. There are many methods which can be adopted and certain circumstances are particularly appropriate to each procurement method for procurement of goods, services and works. The precise selection of procurement method at the beginning of the procurement activity is therefore a significant aspect in the success of the procurement process as incorrect choice of procurement method may have an adverse effect on the bidding process. Not all project procurements are the same. Unless the project carefully makes an assessment of the items it will make, versus the items it will buy, and then adequately plans for these purchases, the risks of performance will increase. Project procurements are simply sub-projects, which need to be managed well, not blindly delegated to an independent organization to buy for the project. Certain procurements, major complexity developments, creating something new, which does not exist, according to the project's unique specification, must be managed by the project team, and supported by the professional procurement organization. The project's team leader must assume the management responsibility. This book zeroes in on the effective management of that portion of the project which will be performed by another organization. It focuses on the procurement of scope from an organization outside of the project. Often, the success or failure of a project is dependent on how well the project can plan, define, solicit, authorize and manage this external relationship. This book has been updated to be consistent with Chapter 12 of the Fourth Edition of the PMBOK® Guide, released by PMI in December 2008. NASA Procurement: Planning for Pilot Test of New Procurement Procedures Is Adequate Building a good budget forms an integral part of any organization's planning and operations. However, many organizations fail to make efficient use of the resources and knowledge they have at hand. Procurement is one such department that is deeply involved in spending but often not involved in the budgeting process. It can benefit both the planning and execution of an organization's budget and find optimal ways to carry out the organization's plans. Procurement can deliver in the most extreme circumstances with tight deadlines despite other perceptions. The 2012 London Olympic and Paralympic Games are widely considered as one of the most successful in history both on and off the track. Sporting world records fell by the wayside while stadiums were delivered on time and under budget, something thought of as near-impossible by the British public in the run-up to the Games. It was such a success that the framework of how it was put together is being used as a benchmark for future Olympics, including the next Games due to be held in the Brazilian city of Rio de Janeiro during the summer of 2016. Procurement was a key part of this success, from building the eye-catching Olympic Park and sports arenas to clothing the thousands of volunteers. But the organizing committee had to overcome a number of its hurdles to get there. While LOCOG's procurement was central to developing and implementing the

contingency plan that saved the situation, it was also key to putting in place clauses within the contract that ensured the public, who were paying for the event, were not left out of pocket as a result of this failure of supply. Abstract: This study aims at investigating the benefits of integrating commodity futures contracts in devising commodity procurement policies as well as the design of supply contracts. To achieve this, a two-tier decentralised supply chain with uncoordinated risk transfer behaviours is studied. Specifically, the supply chain consists of a risk-neutral manufacturer (he) and a risk-averse retailer (she), where both players maximise their own objective functions by utilising the demand forecast update over the planning horizon. The mean-variance utility is employed to capture the retailer's risk aversion behaviour. For the first objective, this study considers a commodity procurement problem for the risk-neutral manufacturer. It shows that partially procuring in the forward market is potentially beneficial because the logistics costs tend to be larger for tighter delivery schedule and vice versa. Existing literature has studied the value of forward procurement. This study further explores the value of the dynamic adjustment in the forward (futures) market in response to the demand information update. Specifically, when the joint distribution of demand and new information is a bivariate normal distribution, the optimal procurement policy is characterized analytically. The second objective is studied within the supply chain setting, where the manufacturer is assumed to be the Stackelberg leader. Recently, various financial hedging strategies have been developed to mitigate the price risks for firms which directly procure commodities for their operations. However, few, if any, studies have addressed the integration of financial hedging with supply contract design so that the risk exposure faced by the downstream player in the supply chain could be partially hedged. Although the downstream retailer does not procure any commodity directly, she may suffer from the commodity price volatility propagated from the upstream manufacturer. By formulating the problem as a dynamic program, a flexible contract with time-consistent closed-form financial hedging policy is derived. Numerical experiments are carried out to demonstrate the benefits gained by integrating the commodity futures contract with supply chain decision making. In the implementation, the short-term/long-term model developed by Schwartz and Smith is adopted to describe the stochastic behaviour of the price. Moreover, to preclude any risk-free arbitrage opportunity, the risk-neutral version of the model is employed. To take full advantage of the historical commodity price data, the smoother-based approach, rather than filter-based approach, is adopted to estimate the latent parameters of the stochastic price processes. For the manufacturer, it is shown that the value of the futures market is significant in the presence of logistics cost. Moreover, extra value could be obtained by adjusting the position in futures contracts in response to the newly observed information. For the decentralised supply chain, compared with the wholesale price contract, it is shown that the proposed flexible contract could improve the performance of the supply chain by leading to higher payoffs for both firms. Furthermore, the results show that flexible contract with financial hedging is effective on mitigating the commodity price risk exposure transferred from the manufacturer to the retailer when measured by standard deviation (SD), value-at-Building a good budget forms an integral part of any organization's planning and operations.
